

Your Responsibilities Are Evolving. Shouldn't Your Tools Evolve, Too?

Competitive intelligence, computer training, knowledge management...

These are just a few of the areas to which law librarians have expanded their input. And though your main responsibility is still research, today's legal environment is challenging you with increased licensing fees from content providers and fewer cost recovery options from a smaller or increasingly savvy client base.

AgentLegal is a comprehensive electronic resource management portal that integrates a firm's

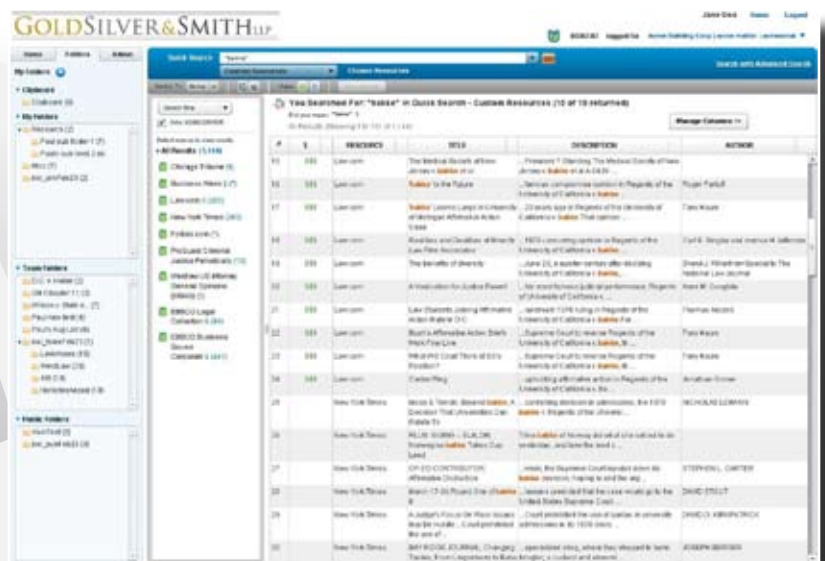

research tools and work product on one robust platform. AgentLegal enables users to gather, organize and share information from multiple, disparate resources, and the portal-based interface simplifies user training by providing a single point of access to all searchable free and licensed content.

You can also track content usage by viewing which resources were searched and which results were

viewed and saved, allowing you to see where your content expenses are paying off and where they can be cut. And a user's ability to track time against AgentLegal activities allows for accurate cost recovery associated with legal research and content collection.

As a law librarian, you connect users to the information they need to make decisions. AgentLegal helps strengthen that connection.

Robust Research Portal
 AgentLegal's federated search technology allows you to access all of your resources using a single robust interface.

FEATURE	BENEFITS	ADVANTAGE
Simultaneously searches multiple, disparate databases and delivers aggregated results within a single federated view	Increases process efficiency and provides thorough information discovery by allowing users to access ANY and ALL content sources through a single interface, regardless of application platform or password requirements.	Unlike search engines or native database tools, AgentLegal uses federated search to access subscription content in addition to internal databases and open web content.
Single sign-on across content sources	Encourages more complete research and increased productivity by removing access barriers to save users time and prevent frustrating, repetitive login requirements.	The administrative platform provides password management to authenticate user access and manage unlimited resource logins, allowing users to access resources without having to remember or input a long list of userids and passwords.
Client, matter and sub-matter usage tracking	Allows resource usage, client, matter and sub-matter tracking for more accurate cost recovery.	Users can track research by client, matter and sub-matter by specifying information at login. AgentLegal supports multiple matters per client and one-to-many sub-matters per matter. Teams and security parameters can be defined at any level.
Content collection	Allows management of downloaded documents and case or project workflow.	Content collection process allows you to more easily locate working documents, as well as assign levels of access to users based on group definitions. Our collection workflow also complements third party content management systems.
E-discovery database building and searching	Eases organization and parsing of e-discovery documents provided by opposing counsel.	AgentLegal allows a batch import from transmittal documents using standard formats like Excel. You can build data repositories for specific clients, cases, projects or any other custom category. The integrated search engine indexes full document content, including annotations and metadata.
Knowledge base building through lists and annotations	Allows easy sharing of information discovery with peers by building internal knowledge bases of specialized content relevant to your firm and its clients.	By building private, public and teams lists, AgentLegal enables you to save and annotate information discovery for future reference, share specific content with client teams or publish relevant information to the entire firm.
Activity reports and system usage metrics	Enables administrators to optimize information resources through the evaluation of usage levels and return on investment (ROI) for fee-based database/content sources.	Tracked statistics can be qualified by database, user, date, client, project and job, and can include detailed information on system activity. Output can be viewed within the application framework or exported into basic formats like Excel. Ad hoc reporting is also supported, with easy integration of industry reporting tools, such as Crystal Reports.

Software as a Service (SaaS) Delivery

By employing the SaaS delivery option, AgentLegal will be fully supported, backed-up and maintained by our qualified staff and includes complete system setup and implementation of software, quick deployment and an easy upgrade path. The solution is also highly scalable, providing the ability to add users as necessary. Additional benefits provided by SaaS include:

- Reduced monetary risk with lower initial investment and total cost of ownership (TCO)
- Elevated customer satisfaction, ensuring broad user adoption and a transparent upgrade process
- Less internal IT involvement with installation and support provided by AgentLegal staff
- Secure and highly available facility and application environment

AgentLegal

AgentLegal enables searching of both internal enterprise databases and free or licensed external content to deliver aggregated results; helps manage e-discovery and other content collection; and tracks charge-back initiatives. The end result is an improved research workflow that increases process efficiency, staff productivity and profit margins. What you don't know will cost you.

With AgentLegal, now you know.
